SLATE is a fine-grained, homogeneous, metamorphic rock. It is derived from an original shale-type sedimentary rock composed of clay or volcanic ash through low-grade regional metamorphism. It is formed over long periods of time out of other existing rock types by heat and pressure.

These minerals and sediments include quartz, mica, muscovite, calcite, and often times biotite, chlorite, and hematite, with occasional instances of apatite, graphite, kaolinite (the main mineral in ceramic clay), magnetite, zircon, and feldspar.

Slate is a durable, finely foliated, and brittle stone, which comes in a wide range of colors, depending on the location and minerals of the slate in question.

It is often black, dark green, and grey, but can also includes instances of red, purple, gold, and blue. The sheer range of colors can fit nearly any design aesthetic, since what many people like about slate is its distinctive appearance.

Slate tile flooring is equally capable of looking charmingly rustic when using a colorful palette, as well as soft contemporary with a grey or black monochromatic color scheme.

Slate has a very low water absorption index making it almost completely waterproof, one of the main reasons why slate is a preferred material for roof tiles, cladding and tiles in wet-rooms as well as for countertops in kitchens.

Chemical sealants are often used on tiles to improve durability and appearance, increase stain resistance, reduce effloresce, and increase or reduce surface smoothness.

Tiles are often sold gauged, meaning that the back surface is ground for ease of installation.

APPLICATIONS

Slate tiles are used for interior and exterior flooring, walls, residential & commercial.

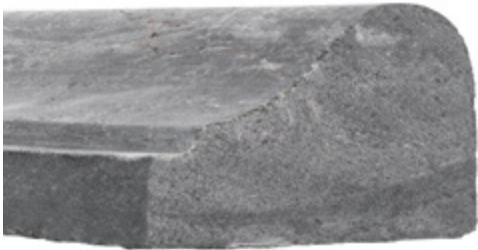

Backsplash, Countertops, Fireplaces, Wall cladding, Pool areas, Patios, Courtyards, Walkways, Pathways, Sidewalks, Stairways, Stepping-stones, Verandas

QUARTZITE is a metamorphic rock, formed when individual grains of quartz-containing sand compress and reform into sandstone. As the sandstone is subjected to intense pressure, it combines with other materials nearby to become quartzite. This process takes place under high heat which creates a heavily resistant material.

Quartzite's intense formation process renders it resistant to temperature fluctuations. It won't crack in extreme hot or cold weather, making it perfect for variable climates and for outdoor use, such as pavers or other garden areas.

Quartzite is available in different hues such as pale reddish-brown, sunset orange tones, greyish-white, yellow, and beige.

It's a decorative stone that enhances the beauty of interior and exterior residential and commercial projects.

Quartzite is naturally fairly water resistant and is not soluble, but just how porous it is largely depends on the variety and how tightly bonded its minerals are. Sealing can give you a piece of mind.

Chemical sealants are often used on tiles to improve durability and appearance, increase stain resistance, reduce effloresce, and increase or reduce surface smoothness.

APPLICATIONS

Quartzite tiles are used for interior and exterior flooring, walls, residential & commercial.

Backsplash, Countertops, Fireplaces, Wall cladding, Pool areas, Patios, Courtyards, Walkways, Pathways, Sidewalks, Stairways, Stepping-stones, Verandas
